VEGETABLES - FRESH MARKET

ANNUAL SUMMARY

1967

In 1967, production was 3 percent more than in 1966 for the 27 principal fresh market vegetables, the Crop Reporting Board announced today. The 1967 production of 222 million hundredweight compares with 1966 production of 215 million hundredweight and the average annual production of 216 million. Crops making major contributions to this year's increased production from 1966 were onions, cabbage, sweet corn, and celery. Record high production levels were estimated for artichokes, broccoli, lettuce, and onions. The 27 principal vegetable and melon crops had a total value of 1,122 million dollars, 1 percent less than a year earlier. Leading crops in value were lettuce and tomatoes whose combined total accounted for 36 percent of the U. S. total.

The 1967 strawberry crop of 478 million pounds, was 3 percent more than last year but 6 percent below average. Production for fresh market accounted for 58 percent of the 1967 strawberry crop and quantities used for processing 42 percent. Also included in this report are estimates for production of mint for oil, which was valued at 33.7 million dollars in 1967.

The five leading States in the 1967 production of fresh vegetable and melons were California, Florida, Texas, Arizona, and New York. These States accounted for 64 percent of the harvested acreage, 70 percent of the production, and 73 percent of the value of the vegetables and melons produced in the United States.

LEADING FRESH MARKET VEGETABLE STATES IN 1967

Rank	Harvested Acreage		Production		Value	
	State	Percent of total	State	Percent of total	State	Percent of total
1	California	25.7	California	34.0	California	36.2
2	Florida	16.3	Florida	16.0	Florida	18.3
3	Texas	13.5	Texas	9.5	Texas	8.4
4	Arizona	4.5	Arizona	5.7	Arizona	6.5
5	New York	4.4	New York	5.1	New York	3.8

Estimates in this publication relate primarily to fresh market production. While estimates for many vegetable crops include only fresh market production, those for a few crops, such as broccoli, cauliflower, and carrots, include substantial quantities processed. For asparagus and strawberries, which are perennial crops providing production for both fresh market and processing outlets from the same acreage, a utilization breakdown is given in addition to total production.

In this publication, the volume of vegetables sold for fresh market use is valued at f.o.b. shipping point, except garlic, for which prices are reported annually on a field run basis at the packinghouse door. The volume sold for processing is valued at the processing plant door--i.e. "equivalent returns at packinghouse door." For vegetables sold both for fresh consumption and for processing, total value is the sum of the values for both types of use. Per unit value is the quotient derived by dividing total value by total quantity. "Per unit value" is not in general a "price" and is not generally used for parity purposes except where one or the other types of utilization is negligible.

(Continued from Page 3)

"Acreage for harvest" in this summary embraces total acreage available for harvest, including mature acreage abandoned or only partially harvested because of low prices, shortage of farm labor, and other economic factors. Planted acreage in this report includes in addition to acreage for harvest, acreage lost or abandoned due to natural causes and acreage abandoned prior to reaching maturity because of economic conditions. Acreage lost and replanted to the same crop early enough to be harvested in the season for which it was originally intended, is counted only once. Acreage lost and replanted to the same crop for harvest in a later season is considered to have been planted in both seasonal classifications but is included as acreage for harvest in the second season only. Acreage lost and replanted to another vegetable crop is included as planted acreage in estimates for both crops but as acreage harvested for the second crop only. Both planted and harvested acreage published for asparagus and strawberries include only bearing acreage and exclude non-bearing acreage planted for harvest in future marketing seasons. Value is for the crop year and does not correspond to calendar year income. All 5-year averages of State and group totals are simple averages of annual data.

This summary provides fresh market estimates for the 27 principal vegetables and melons grown commercially in the more important producing States. These estimates provide basic statistics on over 80 percent of the national output of all vegetables and melons grown for fresh market sale. It has not been possible to include all vegetables in all States in this program.

These data are based upon information secured from growers, shippers, processors, public agencies, and other sources.

Revised estimates for the years 1959-65 were issued in August 1967 in Statistical Bulletin No. 412.
